Initial conditions - steady state

Ice Stream C stopped after 200 years

model vs. observations

Siple Coast ice streams supply most of the ice volume flowing into the Ross Ice Shelf (henceforth the RIS). If the mass... that the Siple Coast ice streams may significantly decrease input of ice mass into the RIS in the near future.

Porosity profiles measured at UpB and UpC [6].

Whenever possible, initial and boundary conditions for...porosity of 40% along the entire profile.
